
In the paper, we use the adjoint operator method as well as technique of symmetric tensor products to extended the Fourier transformation onto the spaces of so-called polynomial rapidly decreasing test functions and polynomial tempered distributions. In such spaces it is possible to solve some Cauchy problems, for example, infinite dimensional heat equation associated with the Gross Laplacian.

Algebraic and differential properties of the polynomial Fourier transformation are investigated. We prove some analogical to classical properties of this map. Unlike to the classic case, the spaces of polynomial test and generalized functions have algebraic structure. We prove that polynomial Fourier transformation acts as homomorphism of appropriate algebras. It is clear that the classical analogue of such property is absent.

1. Introduction. Integral transformations of test and generalized functions have found a wide range of applications in the theory of differential equations, mathematical physics and other branches of mathematics. Various types of such transforms, their properties and applications have been presented in [2, 11].

However, a numerous problems in applied mathematics require a polynomial (nonlinear) generalization of distribution concept. Besides, an algebraic structure of a space of distributions is desirable, which is needed, for example, in quantum field theory [1].

A new approach, that applies the theory of locally convex tensor products together with techniques on symmetric tensor products, is proposed in the papers [5, 9] in order to obtain different polynomial extensions of spaces of ultradifferentiable functions and ultradistributions. In such spaces it is possible to construct a functional calculus for functions of infinity many variables [14] and to solve some Cauchy problems, for example, infinite dimensional heat equation associated with the Gross Laplacian [13].

Note, that there are other known and widely used infinite-dimensional generalizations of classical distribution spaces which are based on modern Gaussian analysis methods as well as the concept of Gelfand triple (see e.g. [6, 8, 10]).

In [5, 15] the Fourier and Laplace transformations on the space of polynomial ultradistributions are considered, in [15] an appropriate Paley-Wiener-type theorem is proved.

*Keywords:* polynomials on infinite-dimensional spaces; rapidly decreasing functions; Schwartz distributions; Fourier transformation.

do:10.30970/ms.53.1.59-68
In this paper, we extend the Fourier transformation on the spaces of polynomial rapidly decreasing test functions and polynomial tempered distributions and prove some algebraic and differential properties of the transformation.

It is known [16], that the Fourier transformation on the Schwartz space of rapidly decreasing functions (as well as on space of tempered distributions) has the following properties $D^mF[f] = F[(it)^m f]$ and $F[D^m f] = (-is)^m F[f]$, where $D^m$ denotes the differentiation operator of the order $m\in \mathbb{Z}_+$. In the paper, we prove analogical properties with $m = 1$ for (generalized) polynomial Fourier transformation (see Theorems 3, 4 and Corollaries 1, 2).

On the other hand, classical Fourier transformation maps a convolution of distributions (if it exists) into a multiplication of respect images, i.e. $F[f * g] = F[f]F[g]$. In Theorem 6 and Corollary 3 we prove the polynomial analogue of this property. The spaces of polynomial test and generalized functions have another algebraic operation, so called Wick product (see formulas (5) and (6)). It is proved, that (generalized) polynomial Fourier transformation acts as homomorphism of appropriate algebras (see Theorem 7 and Corollary 4). It is clear that the classical analogue of this property is absent.

2. Preliminaries and definitions. In what follows $\mathcal{L}(\mathcal{X}, \mathcal{Y})$ denotes the space of all continuous linear operators acting from a locally convex space $\mathcal{X}$ to another such space $\mathcal{Y}$, endowed with the topology of uniform convergence on bounded subsets of $\mathcal{X}$. Let $\mathcal{L}(\mathcal{X}) := \mathcal{L}(\mathcal{X}, \mathcal{X})$. The identity operator in $\mathcal{L}(\mathcal{X})$ always be denoted by $I_{\mathcal{X}}$. The dual space $\mathcal{X}^\prime := \mathcal{L}(\mathcal{X}, \mathbb{C})$ is endowed with strong topology. The pairing between elements of $\mathcal{X}^\prime$ and $\mathcal{X}$ we denote $\langle \cdot, \cdot \rangle$.

Let $\mathcal{X}^\otimes n$ (resp. $\mathcal{X}^\otimes n_0$), $n \in \mathbb{N}$, be the usual (resp. symmetric) $n$th tensor degree of $\mathcal{X}$, completed in the projective tensor topology. For any $x \in \mathcal{X}$ we denote $x^\otimes n := \underbrace{x \otimes \cdots \otimes x}_{n} \in \mathcal{X}^\otimes n$, $n \in \mathbb{N}$. Set $\mathcal{X}^\otimes 0 := \mathbb{C}$, $x^\otimes 0 := 1 \in \mathbb{C}$.

Let $\mathcal{S}_p$ be the Banach space of infinitely differentiable functions on $\mathbb{R}$ with the finite norm

$$
\|\varphi\|_p := \sup_{t \in \mathbb{R}} \sup_{0 \leq m \leq p} (1 + t^2)^{p/2} \left| D^m \varphi(t) \right|,
$$

where $D^m$ denotes the differentiation operator of the order $m \in \mathbb{Z}_+$. Each inclusion $\mathcal{S}_{p+1} \subset \mathcal{S}_p$, $p \in \mathbb{Z}_+$, is compact (see [16, 17]). So the Schwartz space $\mathcal{S} := \bigcap_{p \in \mathbb{Z}_+} \mathcal{S}_p$ of all infinitely differentiable rapidly decreasing functions on $\mathbb{R}$ we can endow with the topology of projective limit $\lim_{\text{proj}} \mathcal{S}_p$ with respect to these inclusions. As a consequence we obtain that $\mathcal{S}$ is Montel nuclear $\mathcal{C}$-space, and its dual space $\mathcal{S}^\prime$ of tempered distributions is Montel nuclear $\mathcal{D}$-space (see [17]). Note that strong topology on $\mathcal{S}^\prime$ coincides with Mackey topology and inductive limit topology (see [12, IV.4, IV.5]).

To define the locally convex space $\mathcal{P}_n(\mathcal{S}^\prime)$ of all continuous $n$-homogeneous polynomials on $\mathcal{S}^\prime$ we use the linear topological isomorphism $\mathcal{P}_n(\mathcal{S}^\prime) \simeq (\mathcal{S}^\otimes n)^\prime$ described in [4]. Indeed, for any functional $p_n \in (\mathcal{S}^\otimes n)^\prime$ let us define an $n$-homogeneous polynomial $P_n \in \mathcal{P}_n(\mathcal{S}^\prime)$ by the formula

$$
P_n(f) := \langle p_n, f^\otimes n \rangle,
$$

(1)

The space $\mathcal{P}_n(\mathcal{S}^\prime)$ will be endowed with the locally convex topology $\mathfrak{b}$ of uniform convergence on bounded subsets of $\mathcal{S}^\prime$. By definition $\mathcal{P}_0(\mathcal{S}^\prime) := \mathbb{C}$. Define the space $\mathcal{P}(\mathcal{S}^\prime)$ of all continuous polynomials on $\mathcal{S}^\prime$ as complex linear span of all $\mathcal{P}_n(\mathcal{S}^\prime)$, $n \in \mathbb{Z}_+$, and endow it with the topology $\mathfrak{b}$. Let $\mathcal{P}(\mathcal{S}^\prime)$ be its strong dual space. In what follows we use the notations

$$
\Gamma(\mathcal{S}) := \bigoplus_{n \in \mathbb{Z}_+} \mathcal{S}^\otimes n \quad \text{and} \quad \Gamma(\mathcal{S}^\prime) := \bigotimes_{n \in \mathbb{Z}_+} \mathcal{S}^\otimes n.
$$
where $\bigoplus$ and $\times$ denote direct sum and cartesian product respectively. Note that we consider the case when the elements of the direct sum consist of finite but not fixed number of addends.

From the results of the article [9] it follows that there exist the following linear topological isomorphisms

$$\Upsilon_n : \mathcal{P}_n(S') \rightarrow S^{\otimes n}, \quad \Psi_n : \mathcal{P}_n(S) \rightarrow S'^{\otimes n},$$

and

$$\Upsilon : \mathcal{P}(S') \rightarrow \Gamma(S), \quad \Psi : \mathcal{P}'(S') \rightarrow \Gamma(S').$$

Elements of the spaces $\mathcal{P}(S')$ and $\mathcal{P}'(S')$ we call the polynomial rapidly decreasing test functions and polynomial tempered distributions respectively. In what follows elements of the spaces $\Gamma(S)$ and $\Gamma(S')$ will be respectively written as

$$\bigoplus_{n=0}^{m} p_n = (p_0, p_1, \ldots, p_m, 0, \ldots) \quad \text{and} \quad \times_{n \in \mathbb{Z}^+} u_n = (u_0, u_1, \ldots, u_n, \ldots)$$

for some $m \in \mathbb{N}$, where $p_k \in S^{\otimes k}$ and $u_k \in S'^{\otimes k}, \: k \in \mathbb{Z}^+$. To simplify, we write $(p_n)$ and $(u_n)$ instead of $\bigoplus_{n=0}^{m} p_n$ and $\times_{n \in \mathbb{Z}^+} u_n$ respectively.

Note that the following systems of elements

$$\{(\varphi^{\otimes n}) : \varphi \in S\}, \quad \{(f^{\otimes n}) : f \in S'\}$$

are total sets in the spaces $\Gamma(S)$ and $\Gamma(S')$ respectively.

The spaces $\mathcal{P}(S')$ and $\mathcal{P}'(S')$ are multiplicative algebras with respect to the convolution type operations

$$P \circ Q := \sum_{n \in \mathbb{Z}^+} \sum_{m=0}^{n} P_m \cdot Q_{n-m} \quad \text{and} \quad U \circ V := \times_{n \in \mathbb{Z}^+} \sum_{m=0}^{n} U_m \cdot V_{n-m}$$

respectively, where

$$P = \sum_{n \in \mathbb{Z}^+} P_n, \quad Q = \sum_{n \in \mathbb{Z}^+} Q_n, \quad P, Q \in \mathcal{P}(S'), \quad P_n, Q_n \in \mathcal{P}_n(S'),$$

$$U = \times_{n \in \mathbb{Z}^+} U_n, \quad V = \times_{n \in \mathbb{Z}^+} V_n, \quad U, V \in \mathcal{P}'(S'), \quad U_n, V_n \in \mathcal{P}_n(S).$$

Note, that in the above formulas $P_m \cdot Q_{n-m}$ and $U_m \cdot V_{n-m}$ denote the usual pointwise multiplication of polynomials.

The direct sum $\Gamma(S)$ and the cartesian product $\Gamma(S')$ are local convex algebras with respect to the convolution type operations

$$p \cdot q := \bigoplus_{n \in \mathbb{Z}^+} \sum_{m=0}^{n} p_m \otimes q_{n-m} \quad \text{and} \quad u \cdot v := \times_{n \in \mathbb{Z}^+} \sum_{m=0}^{n} u_m \otimes v_{n-m}$$

respectively, where $P = (p_n), \quad Q = (q_n), \quad p, q \in \Gamma(S), \quad P_n, Q_n \in S^{\otimes n}, \quad u = (u_n), \quad v = (v_n), \quad u, v \in \Gamma(S'), \quad u_n, v_n \in S'^{\otimes n}.$

Note that, the convolution type operations (5), (6) play an important role in stochastic analysis, they are called the Wick product in the literature (see, e.g., [3, 7]).
The mappings (3) act as algebraic isomorphisms, i.e.
\[ \Upsilon: \{ \mathcal{P}(S'), \circ \} \rightarrow \{ \Gamma(S), \circ \}, \quad \Psi: \{ \mathcal{P}'(S'), \circ \} \rightarrow \{ \Gamma(S'), \circ \}. \]

3. Polynomial generalization of the Fourier transform. As is well known the usual Fourier transformation
\[ F: \mathcal{S} \in \varphi(t) \rightarrow [F\varphi](\xi) := \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} e^{-it\xi} \varphi(t) \, dt \in \mathcal{S} \]
acts as continuous bijection from the space \( \mathcal{S} \) onto itself. Let \( F': \mathcal{L}(\mathcal{S}') \) be the generalized Fourier transformation on the space \( \mathcal{S}' \), i.e. the map defined by the formula
\[ \langle F'f, \varphi \rangle = \langle f, F\varphi \rangle, \quad f \in \mathcal{S}', \quad \varphi \in \mathcal{S}. \]

For each natural \( n \) we define the operators \( F^\otimes n \in \mathcal{L}(\mathcal{S}^\otimes n) \) and \( F'^\otimes n \in \mathcal{L}(\mathcal{S}'^\otimes n) \) as linear and continuous extensions of mappings
\[
\begin{align*}
\varphi_1 \otimes \ldots \otimes \varphi_n & \mapsto F\varphi_1 \otimes \ldots \otimes F\varphi_n, \quad \varphi_i \in \mathcal{S}, \quad i = 1, \ldots, n, \\
f_1 \otimes \ldots \otimes f_n & \mapsto F'f_1 \otimes \ldots \otimes F'f_n, \quad f_i \in \mathcal{S}', \quad i = 1, \ldots, n,
\end{align*}
\]
respectively, and let \( F'^{\otimes 0} := F'^\otimes := I_\mathbb{C} \) by definition.

We define the operators \( F^\otimes \in \mathcal{L}(\Gamma(\mathcal{S})) \) and \( F'^\otimes \in \mathcal{L}(\Gamma(\mathcal{S}')) \) as follows:
\[
\begin{align*}
F^\otimes := \bigotimes_{n \in \mathbb{Z}_+} F^\otimes n: \quad & \Gamma(\mathcal{S}) \ni p = (p_n) \mapsto F^\otimes p := (F^\otimes n p_n) \in \Gamma(\mathcal{S}), \\
F'^\otimes := \bigotimes_{n \in \mathbb{Z}_+} F'^\otimes n: \quad & \Gamma(\mathcal{S}') \ni u = (u_n) \mapsto F'^\otimes u := (F'^\otimes n u_n) \in \Gamma(\mathcal{S}'),
\end{align*}
\]
where \( p_n \in \mathcal{S}^\otimes n, \ u_n \in \mathcal{S}'^\otimes n \).

**Theorem 1.** The following diagrams
\[
\begin{array}{ccc}
\mathcal{P}_n(S') & \xrightarrow{F^\otimes n_p} & \mathcal{P}_n(S') \\
\Upsilon_n^{-1} \downarrow & & \downarrow \Upsilon_n^{-1} \\
\mathcal{S}^\otimes n & \xrightarrow{F^\otimes n} & \mathcal{S}^\otimes n \\
\end{array}
\quad
\begin{array}{ccc}
\mathcal{P}_n(S) & \xrightarrow{F'^\otimes n_p} & \mathcal{P}_n(S) \\
\Psi_n^{-1} \downarrow & & \downarrow \Psi_n^{-1} \\
\mathcal{S}^\otimes n & \xrightarrow{F'^\otimes n} & \mathcal{S}^\otimes n \\
\end{array}
\]

uniquely define linear continuous operators \( F^\otimes n_p \in \mathcal{L}(\mathcal{P}_n(S')) \) and \( F'^\otimes n_p \in \mathcal{L}(\mathcal{P}_n(S)) \), which are adjoint to each other.

**Proof.** Isomorphisms (2) imply that above diagrams are commutative. So, linear mappings \( F^\otimes n_p := \Upsilon_n^{-1} \circ F^\otimes n \circ \Upsilon_n \) and \( F'^\otimes n_p := \Psi_n^{-1} \circ F'^\otimes n \circ \Psi_n \) uniquely can be defined by the following equalities (see formula (1))
\[
\begin{align*}
[F^\otimes n_p f_n](f) = \langle p_n, F^\otimes n f_n \rangle, \quad f \in \mathcal{S}', \quad p_n \in \mathcal{P}_n(S'), \\
[F'^\otimes n_p u_n](\varphi) = \langle u_n, F'^\otimes n \varphi \rangle, \quad \varphi \in \mathcal{S}, \quad u_n \in \mathcal{P}_n(S),
\end{align*}
\]
where \( p_n := \Upsilon_n P_n \in \mathcal{S}^\otimes n \simeq (\mathcal{S}^\otimes n)', \ u_n := \Psi_n U_n \in \mathcal{S}'^\otimes n \simeq (\mathcal{S}'^\otimes n)' \).

What is left to show that the operators \( F^\otimes n \) and \( F'^\otimes n \) are continuous. Note, that these operators are mutually adjoint, i.e.
\[
\langle F'f_1 \otimes \ldots \otimes F'f_n, \varphi_1 \otimes \ldots \otimes \varphi_n \rangle = \langle f_1 \otimes \ldots \otimes f_n, F\varphi_1 \otimes \ldots \otimes F\varphi_n \rangle,
\]
where \( f_1 \otimes \ldots \otimes f_n \in S^{\otimes n} \), \( \varphi_1 \otimes \ldots \otimes \varphi_n \in S^{\otimes n} \), \( f_i \in \mathcal{S} \), \( \varphi_i \in \mathcal{S} \), \( i = 1, \ldots, n \).

The continuity of the Fourier transformation on \( \mathcal{S} \) is well known (see [16]): for any \( m \in \mathbb{Z}_+ \) there exists a constant \( C_m \) such that \( \| F \varphi \|_m \leq C_m \| \varphi \|_{m+2} \). So, for any continuous seminorm \( q_1 \otimes \ldots \otimes q_n \) on \( S^{\otimes n} \) there exist constants \( C_{i_1}, \ldots, C_{i_n} \) and indexes \( m_{i_1}, \ldots, m_{i_n}, \) \( i = 1, \ldots, k \), such that

\[
(q_1 \otimes \ldots \otimes q_n)(F^{\otimes n} \varphi) = \inf \sum_{i=1}^k \| F \varphi_{i_1} \|_{m_{i_1}} \cdots \| F \varphi_{i_n} \|_{m_{i_n}} \leq C \sum_{i=1}^k C_{i_1} \varphi_{i_1} \|_{m_{i_1}+2} \cdots C_{i_n} \varphi_{i_n} \|_{m_{i_n}+2} = C(p_1 \otimes \ldots \otimes p_n)(\varphi),
\]

where the infimum is taken over all representations of an element \( \varphi \in S^{\otimes n} \) in the form \( \varphi = \sum_{i=1}^k \varphi_{i_1} \otimes \cdots \otimes \varphi_{i_n}, \varphi_{i_j} \in \mathcal{S}, i = 1, \ldots, k, j = 1, \ldots, n \). It implies the continuity of the operator \( F^{\otimes n} : S^{\otimes n} \to S^{\otimes n}. \)

The symmetrization projector

\[
s_n : S^{\otimes n} \ni \varphi_1 \otimes \cdots \otimes \varphi_n \mapsto \varphi_1 \hat{\otimes} \cdots \hat{\otimes} \varphi_n := \frac{1}{n!} \sum_{\sigma} \varphi_{\sigma(1)} \otimes \cdots \otimes \varphi_{\sigma(n)},
\]

where the sum is taken over all permutations \( \sigma \) of the set \( \{1, 2, \ldots, n\} \), is continuous. It easy to see, that \( s_n \circ F^{\otimes n} = F^{\otimes n} \circ s_n \), since the set of symmetric tensors is invariant with respect to the action of the operator \( F^{\otimes n} \). Hence, the restriction \( F^{\otimes n} : S^{\otimes n} \to S^{\otimes n} \) is continuous.

The proof of continuity of the adjoint operator \( F^{\otimes n} : S^{\otimes n} \to S^{\otimes n} \) is similar. \( \square \)

**Theorem 2.** The following diagrams

\[
\begin{array}{ccc}
\mathcal{P}(\mathcal{S}') & \xrightarrow{F_p^{\otimes}} & \mathcal{P}(\mathcal{S}') \\
\Upsilon^{-1} & \Downarrow \Upsilon & \Upsilon^{-1} \Downarrow \Upsilon \\
\Gamma(\mathcal{S}) & \xrightarrow{F^{\otimes}} & \Gamma(\mathcal{S})
\end{array}
\quad
\begin{array}{ccc}
\mathcal{P}'(\mathcal{S}') & \xrightarrow{F_p^{\otimes}} & \mathcal{P}'(\mathcal{S}') \\
\psi^{-1} & \Downarrow \psi & \psi^{-1} \Downarrow \psi \\
\Gamma(\mathcal{S}') & \xrightarrow{F^{\otimes}} & \Gamma(\mathcal{S}')
\end{array}
\]

uniquely define linear continuous operators \( F_p^{\otimes} \in \mathcal{L}(\mathcal{P}(\mathcal{S}')) \), \( F_p^{\otimes} \in \mathcal{L}(\mathcal{P}'(\mathcal{S}')) \), which are adjoint to each other.

**Proof.** Isomorphisms (3) imply that above diagrams are commutative. So, linear mappings \( F_p^{\otimes} := \Upsilon^{-1} \circ F^{\otimes} \circ \Upsilon \) and \( F_p^{\otimes} := \psi^{-1} \circ F^{\otimes} \circ \psi \) uniquely can be defined by the following equalities

\[
F_p^{\otimes} P := \sum_{n \in \mathbb{Z}_+} F_p^{\otimes n} P_n, \quad F_p^{\otimes} U := \sum_{n \in \mathbb{Z}_+} F_p^{\otimes n} U_n,
\]

where

\[
P = \sum_{n \in \mathbb{Z}_+} P_n \in \mathcal{P}(\mathcal{S}'), \quad P_n \in \mathcal{P}_n(\mathcal{S}'), \quad U = \sum_{n \in \mathbb{Z}_+} U_n \in \mathcal{P}(\mathcal{S}'), \quad U_n \in \mathcal{P}_n(\mathcal{S}).
\]

Theorem 1 implies the following equalities

\[
\langle U, F_p^{\otimes} P \rangle = \langle \sum_{n \in \mathbb{Z}_+} F_p^{\otimes n} P_n, \sum_{n \in \mathbb{Z}_+} F_p^{\otimes n} P_n \rangle = \sum_{n \in \mathbb{Z}_+} \langle F_p^{\otimes n} U_n, P_n \rangle = \langle F_p^{\otimes} U, P \rangle = \langle \sum_{n \in \mathbb{Z}_+} F_p^{\otimes n} U_n, \sum_{n \in \mathbb{Z}_+} P_n \rangle = \langle F_p^{\otimes} U, P \rangle,
\]

where
Hence, from the definitions of locally convex topologies of direct sum and cartesian product it follows the continuity of the operators $F_p^{\otimes n}$ and $F_p^{\otimes \delta}$. Therefore the operators $F_p^{\otimes n}$ and $F_p^{\otimes \delta}$ are mutually adjoint.

In the proof of the Theorem 1 we have shown continuity of the operators $F_p^{\otimes n}$ and $F_p^{\otimes \delta}$. Hence, from the definitions of locally convex topologies of direct sum and cartesian product it follows the continuity of the operators $F_p^{\otimes n} \in \mathcal{L}(\mathcal{P}(S'))$ and $F_p^{\otimes \delta} \in \mathcal{L}(\mathcal{P}'(S'))$. □

The mapping $F_p^{\otimes n} \in \mathcal{L}(\mathcal{P}(S'))$ (respectively $F_p^{\otimes n} \in \mathcal{L}(\mathcal{P}'(S'))$), defined in Theorem 2, we will call (respectively generalized) polynomial Fourier transformation.

4. Auxiliary operations. Let $D' \in \mathcal{L}(S')$ be the operator of usual differentiation, i.e. the map defined by the formula $\langle D'f, \varphi \rangle = -\langle f, D\varphi \rangle$, $f \in S'$, $\varphi \in S$, where $D$ denotes the operator of usual differentiation in $S$. Let us extend the operators $D \in \mathcal{L}(S)$ and $D' \in \mathcal{L}(S')$ onto the spaces $\Gamma(S)$ and $\Gamma(S')$ respectively. Namely, define the operators $D \in \mathcal{L}(\Gamma(S))$ and $D' \in \mathcal{L}(\Gamma(S'))$ by the following formulas

$$D_p := \bigoplus_{n \in \mathbb{Z}_+} D^{(\otimes)n}_p \varphi^{\otimes n}, \quad p = (\varphi^{\otimes n}) \in \Gamma(S), \quad \varphi \in S,$$

$$D'_p := \bigotimes_{n \in \mathbb{Z}_+} D^{(\otimes)n}_p f^{\otimes n}, \quad u = (f^{\otimes n}) \in \Gamma(S'), \quad f \in S',$$

where $D^{(\otimes)n}_0$ and $D^{(\otimes)n}_{\delta}$ are null operators and

$$D^{(\otimes)n}_p \varphi^{\otimes n} := \sum_{j=1}^{n} \varphi^{(j-1)} \otimes D \varphi \otimes \varphi^{(n-j)}, \quad n \in \mathbb{N}$$

$$D^{(\otimes)n}_p f^{\otimes n} := \sum_{j=1}^{n} f^{(j-1)} \otimes D' f \otimes f^{(n-j)}, \quad n \in \mathbb{N}.$$

Let us define the operator $M \in \mathcal{L}(S)$ of multiplication on the independent variable by $M: S \ni \varphi(t) \longmapsto -it\varphi(t) \in S$ and let $M' \in \mathcal{L}(S')$ be its adjoint map, i.e. $\langle M'f, \varphi \rangle = \langle f, M\varphi \rangle$, $f \in S'$, $\varphi \in S$. Next we extend these operators onto the spaces $\Gamma(S)$ and $\Gamma(S')$ in analogous way. Namely, define the operators $M \in \mathcal{L}(\Gamma(S))$ and $M' \in \mathcal{L}(\Gamma(S'))$ by

$$M_p := \bigoplus_{n \in \mathbb{Z}_+} M^{(\otimes)n}_p \varphi^{\otimes n}, \quad p = (\varphi^{\otimes n}) \in \Gamma(S), \quad \varphi \in S,$$

$$M'_p := \bigotimes_{n \in \mathbb{Z}_+} M^{(\otimes)n}_p f^{\otimes n}, \quad u = (f^{\otimes n}) \in \Gamma(S'), \quad f \in S',$$

where $M^{(\otimes)n}_0$ and $M^{(\otimes)n}_{\delta}$ are null operators and

$$M^{(\otimes)n}_p \varphi^{\otimes n} := \sum_{j=1}^{n} \varphi^{(j-1)} \otimes M \varphi \otimes \varphi^{(n-j)}, \quad n \in \mathbb{N}$$

$$M^{(\otimes)n}_p f^{\otimes n} := \sum_{j=1}^{n} f^{(j-1)} \otimes M' f \otimes f^{(n-j)}, \quad n \in \mathbb{N}.$$

The following commutative diagrams

$$\begin{align*}
\mathcal{P}(S') & \xrightarrow{D_p} \mathcal{P}(S') & \mathcal{P}'(S') & \xrightarrow{D'_p} \mathcal{P}'(S') \\
\Gamma(S) & \xrightarrow{M} \Gamma(S) & \Gamma(S) & \xrightarrow{M'} \Gamma(S')
\end{align*}$$

\begin{align*}
\gamma^{-1} & \xrightarrow{\gamma^{-1}} \gamma & \psi^{-1} & \xrightarrow{\psi^{-1}} \psi
\end{align*}
uniquely define linear continuous operators $D_P := \Upsilon^{-1} \circ D \circ \Upsilon \in L(\mathcal{P}(\mathcal{S}'))$, $M_P := \Upsilon^{-1} \circ M \circ \Upsilon \in L(\mathcal{P}(\mathcal{S}'))$, $D_P' := \Psi^{-1} \circ D' \circ \Psi \in L(\mathcal{P}'(\mathcal{S}'))$ and $M_P' := \Psi^{-1} \circ M' \circ \Psi \in L(\mathcal{P}'(\mathcal{S}'))$.

5. Differential properties.

**Theorem 3.** For any elements $p \in \Gamma(\mathcal{S})$ and $u \in \Gamma(\mathcal{S}')$ the following equalities are valid

$$D[F^\otimes p] = F^\otimes [Mp], \quad D'[F^\otimes u] = F^\otimes [M'u]. \tag{8}$$

**Proof.** It easy to see, that for any $\varphi \in \mathcal{S}$ we have

$$D[F\varphi](\xi) = \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} (-it)e^{-it\xi}\varphi(t) \, dt = F[M\varphi],$$

$$F[D\varphi](\xi) = \frac{1}{\sqrt{2\pi}} \int_{\mathbb{R}} e^{-it\xi}\varphi'(t) \, dt = \frac{i\xi}{\sqrt{2\pi}} \int_{\mathbb{R}} e^{-it\xi}\varphi(t) \, dt = -M[F\varphi].$$

It follows

$$\langle D'[F'f], \varphi \rangle = -\langle F'f, D\varphi \rangle = -\langle f, F[D\varphi] \rangle = \langle f, M[F\varphi] \rangle = \langle M'f, F\varphi \rangle = \langle F'[M'f], \varphi \rangle,$$

so, $D'[F'f] = F'[M'f]$.

It is clear, that we only need to check the equalities (8) on total subsets (4) in $\Gamma(\mathcal{S})$ and $\Gamma(\mathcal{S}')$. Let $p = (\varphi^\otimes n)$ and $u = (f^\otimes n)$ with $\varphi \in \mathcal{S}$ and $f \in \mathcal{S}'$.

Then we have

$$D[F^\otimes p] = D\left[ \bigoplus_{n \in \mathbb{Z}_+} F^\otimes n \varphi^\otimes n \right] = D\left[ \bigoplus_{n \in \mathbb{Z}_+} (F\varphi)^\otimes n \right] = \bigoplus_{n \in \mathbb{Z}_+} D[(\otimes)^n (F\varphi)^{\otimes n} = 0 \bigoplus \bigoplus_{n \in \mathbb{N}} \sum_{j=1}^{\infty} (F\varphi)^{\otimes j} \otimes D[F\varphi] \otimes (F\varphi)^{\otimes (n-j)} = 0 \bigoplus \bigoplus_{n \in \mathbb{N}} \sum_{j=1}^{\infty} (F\varphi)^{\otimes j} \otimes D[M\varphi] \otimes (F\varphi)^{\otimes (n-j)} = 0 \bigoplus \bigoplus_{n \in \mathbb{N}} \bigoplus_{j=1}^{n} \varphi^{\otimes j} \otimes M\varphi \otimes \varphi^{\otimes (n-j)} = 0 \bigoplus \bigoplus_{n \in \mathbb{N}} \bigoplus_{j=1}^{n} \varphi^{\otimes j} \otimes M\varphi \otimes \varphi^{\otimes (n-j)} = 0 \bigoplus \bigoplus_{n \in \mathbb{N}} F^\otimes n M^{(\otimes)^n \varphi^\otimes n} = F^\otimes [Mp],$$

and

$$D'[F^\otimes u] = D'\left[ \bigotimes_{n \in \mathbb{Z}_+} F^\otimes n f^\otimes n \right] = D'\left[ \bigotimes_{n \in \mathbb{N}} (F'f)^\otimes n \right] = \bigotimes_{n \in \mathbb{Z}_+} D'[\otimes^n (F'f)^\otimes n = 0 \bigotimes \bigotimes_{n \in \mathbb{N}} \sum_{j=1}^{\infty} (F'f)^{\otimes j} \otimes D'[F'f] \otimes (F'f)^{\otimes (n-j)} = 0 \bigotimes \bigotimes_{n \in \mathbb{N}} \sum_{j=1}^{\infty} (F'f)^{\otimes j} \otimes F'[M'f] \otimes (F'f)^{\otimes (n-j)} = 0 \bigotimes \bigotimes_{n \in \mathbb{N}} F^\otimes n \sum_{j=1}^{\infty} (f^{\otimes j}) \otimes M'f \otimes f^{\otimes (n-j)} = 0 \bigotimes \bigotimes_{n \in \mathbb{N}} F^\otimes n M^{(\otimes)^n f^\otimes n} = F^\otimes [M'u].$$

\qed
Corollary 1. For any elements \( P \in \mathcal{P}(S') \) and \( U \in \mathcal{P}'(S') \) the following equalities are valid
\[
\mathbb{D}_P[F \otimes P] = F \otimes [\mathbb{M}_P P], \quad \mathbb{D}_P[F \otimes U] = F \otimes [\mathbb{M}_P U].
\]

Theorem 4. For any elements \( p \in \Gamma(S) \) and \( u \in \Gamma(S') \) the following equalities are valid
\[
F \otimes [\mathbb{D} p] = -\mathbb{M}[F \otimes p], \quad F \otimes [\mathbb{D}' u] = -\mathbb{M}'[F \otimes u].
\]

**Proof.** For any elements \( p = (\varphi \otimes n) \) and \( u = (f \otimes n) \) with \( \varphi \in S \) and \( f \in S' \) from the respective total subsets (4) we have
\[
F \otimes [\mathbb{D} p] = F \otimes \left[ 0 \oplus \bigoplus_{n \in \mathbb{N}} D^{(\otimes)n} \varphi \otimes n \right] = 0 \oplus \bigoplus_{n \in \mathbb{N}} F \otimes n D^{(\otimes)n} \varphi \otimes n =
\]
\[
= 0 \oplus \bigoplus_{n \in \mathbb{N}} F \otimes n \sum_{j=1}^{n} \varphi^{(j-1)} \otimes D \varphi \otimes (n-j) =
\]
\[
= 0 \oplus \bigoplus_{n \in \mathbb{N}} \sum_{j=1}^{n} (F \varphi)^{(j-1)} \otimes F[D \varphi] \otimes (F \varphi)^{(n-j)} =
\]
\[
= -0 \oplus \bigoplus_{n \in \mathbb{N}} \sum_{j=1}^{n} (F \varphi)^{(j-1)} \otimes M[F \varphi] \otimes (F \varphi)^{(n-j)} = -0 \oplus \bigoplus_{n \in \mathbb{N}} M^{(\otimes)n}(F \varphi)^{\otimes n} = -\mathbb{M}[F \otimes p].
\]

It easy to check that for any \( f \in S' \) and \( \varphi \in S \) the following is true
\[
\langle F'[D' f], \varphi \rangle = \langle D' f, F \varphi \rangle = -\langle f, D[F \varphi] \rangle = -\langle f, F[M \varphi] \rangle = -\langle f', M \varphi \rangle = -\langle M'[F' f], \varphi \rangle.
\]

It implies
\[
F \otimes [\mathbb{D}' u] = F \otimes \left[ 0 \times \bigtimes_{n \in \mathbb{N}} D'^{(\otimes)n} f \otimes n \right] = 0 \times \bigtimes_{n \in \mathbb{N}} F \otimes n D'^{(\otimes)n} f \otimes n =
\]
\[
= 0 \times \bigtimes_{n \in \mathbb{N}} F \otimes n \sum_{j=1}^{n} f^{(j-1)} \otimes D' f \otimes (n-j) =
\]
\[
= 0 \times \bigtimes_{n \in \mathbb{N}} \sum_{j=1}^{n} (F' f)^{(j-1)} \otimes F[D' f] \otimes (F' f)^{(n-j)} =
\]
\[
= -0 \times \bigtimes_{n \in \mathbb{N}} \sum_{j=1}^{n} (F' f)^{(j-1)} \otimes M'[F' f] \otimes (F' f)^{(n-j)} =
\]
\[
= -0 \times \bigtimes_{n \in \mathbb{N}} M'^{(\otimes)n} F \otimes n f \otimes n = -\mathbb{M}'[F \otimes u].
\]

\( \square \)

**Corollary 2.** For any elements \( P \in \mathcal{P}(S') \) and \( U \in \mathcal{P}'(S') \) the following equalities are valid
\[
F \otimes_P [\mathbb{D} P] = -\mathbb{M}_P[F \otimes_P P], \quad F \otimes_P [\mathbb{D}' U] = -\mathbb{M}'_P[F \otimes_P U].
\]

6. Algebraic properties. Let \( \mathcal{E}' \subset S' \) be the space of generalized functions with compact supports. Denote \( \Gamma(\mathcal{E}') := \times_{n \in \mathbb{Z}_+} \mathcal{E}'^{\otimes n} \). It is clear that \( \Gamma(\mathcal{E}') \subset \Gamma(S') \).

In [16] it is proved the following assertion.
Theorem 5 ([16]). Let \( f \in S' \) and \( g \in E' \). Then \( f \ast g \in S' \) is well defined, moreover \( F'[f \ast g] = F'[f] \cdot F'[g] \).

Let us generalize this property onto the space \( \Gamma(S') \).

For elements \((f^{\otimes n}), (g^{\otimes n})\), \( f, g \in S' \), from total subset of \( \Gamma(S') \) we define two operations
\[
(f^{\otimes n}) \ast (g^{\otimes n}) := ((f \ast g)^{\otimes n}) \quad \text{and} \quad (f^{\otimes n}) \circ (g^{\otimes n}) := ((f \cdot g)^{\otimes n})
\]
and extend them on \( \Gamma(S') \) by linearity and continuity. Note, that these operations are not well defined on whole space \( \Gamma(S') \). But the following result is true, it is a consequence of the Theorem 5.

Theorem 6. Let \( u \in \Gamma(S') \) and \( v \in \Gamma(E') \). Then \( u \ast v \in \Gamma(S') \) is well defined, moreover
\[
F'[u \ast v] = F'[u] \odot F'[v].
\]

Proof. It is enough to prove the assertion only on the elements of total subsets (4). Let \( u = (f^{\otimes n}) \in \Gamma(S') \), \( v = (g^{\otimes n}) \in \Gamma(E') \), where \( f \in S' \), \( g \in E' \). Then
\[
F'[u \ast v] = \bigotimes_{n \in \mathbb{Z}_+} F'[f \ast g]^{\otimes n} = \bigotimes_{n \in \mathbb{Z}_+} (F'[f] \cdot F'[g])^{\otimes n} = F'[u] \odot F'[v].
\]

Using the second of the diagrams (7) we can “extend” the operations \( \ast \) and \( \circ \) onto the space \( P(S') \) of polynomial distributions.

Corollary 3. Let \( U \in P'(S') \) and \( V \in P'(E') \). Then \( U \odot V \in P'(S') \) is well defined, moreover
\[
F'_p[U \odot V] = F'_p[U] \odot F'_p[V].
\]

Remind, that spaces \( \Gamma(S) \) and \( \Gamma(S') \) are topological algebras with respect to operations (6). Polynomial generalization of the Fourier transformation acts as a homomorphism on these algebras. Namely, the following assertion is valid.

Theorem 7. The mappings \( F' \) and \( F'^{\otimes} \) are homomorphisms on algebras \( \{\Gamma(S), \odot\} \) and \( \{\Gamma(S'), \circ\} \) respectively, i.e.
\[
\begin{align*}
F'\odot[p \odot q] &= F'\odot p \odot F'\odot q, \quad \forall p, q \in \Gamma(S), \\
F'^{\otimes}[u \circ v] &= F'^{\otimes} u \circ F'^{\otimes} v, \quad \forall u, v \in \Gamma(S').
\end{align*}
\]

Proof. The following equalities
\[
F'\odot[p \odot q] = F'\odot \bigotimes_{n \in \mathbb{Z}_+} \sum_{k=0}^n (\varphi^{\otimes k} \psi^{\otimes (n-k)}) = \bigotimes_{n \in \mathbb{Z}_+} \sum_{k=0}^n (\varphi^{\otimes k} \psi^{\otimes (n-k)}) = F'\odot p \odot F'\odot q,
\]
\[
F'^{\otimes}[u \circ v] = F'^{\otimes} \bigotimes_{n \in \mathbb{Z}_+} \sum_{k=0}^n (F' \varphi)^{\otimes k} (F' \psi)^{\otimes (n-k)} = F'^{\otimes} u \circ F'^{\otimes} v,
\]
are valid for any \( p = (\varphi^{\otimes n}) \in \Gamma(S) \), \( q = (\psi^{\otimes n}) \in \Gamma(S) \), \( u = (f^{\otimes n}) \in \Gamma(S') \), \( v = (g^{\otimes n}) \in \Gamma(S') \), where \( \varphi, \psi \in S \), \( f, g \in S' \).
Using the formula (5) following assertion can be proved analogically as the Theorem 7.

**Corollary 4.** The mappings $F_P^\otimes$ and $F'_P^\otimes$ are homomorphisms on algebras $\{\mathcal{P}(S'), \cdot \}$ and $\{\mathcal{P}'(S'), \cdot \}$ respectively, i.e.

\[
F_P^\otimes [P \cdot Q] = F_P^\otimes P \cdot F_P^\otimes Q, \quad \forall P, Q \in \mathcal{P}(S'),
\]
\[
F_P^\otimes [U \cdot V] = F_P^\otimes U \cdot F_P^\otimes V, \quad \forall U, V \in \mathcal{P}'(S').
\]
